```

The present invention relates to a new human Cytochrome P450, Subfamily XXVIIA, (Steroid 27-Hydroxylase, Cerebrocendinous Xanthomatosis)

Exvisa (Steroid 27-Hydroxylase, Cerebrocendinous Xanthomatosis)

Polypeptide I (CYP27A1) polymotolotide. The polymotophic variant for a reference sequence which is a polymotophic variant for a polymotophic variant for a reference sequence for a CYP27A1 gene or its fragment, or a polymorphic variant of a reference sequence for a CYP27A1 gene or its fragment. The invention is useful for screening for drugs by contacting the CYP27A1 polymorphic variant with a candidate agent and assaying for binding activity, etc. of CYP27A1, and in expressing CYP27A1 protein for use in screening for candidate drugs to treat diseases related to CYP27A1 activity, etc. of cerebrotendinous xanthomatosis. Other uses include for therapeutic purposes and for studying expression of the CYP27A1 isogenes in vivo, for in vivo screening and testing of drugs targeted against compounds for diseases associated with CYP27A1 activity, etg.

CYP27A1 protein, and for testing the efficacy of therapeutic agents and compounds for diseases associated with CYP27A1 activity, etg.

CYP27A1 protein, and for testing the efficacy of therapeutic agents and compounds for diseases associated with CYP27A1 activity, etg.

CYP27A1 protein, and for testing the efficacy of therapeutic agents and compounds for diseases associated with CYP27A1 activity etg.

CYP27A1 as well as on the binding affinity of candidate drugs targeted against and activity of CYP27A1 as well as on the binding affinity of candidate drugs targeted and activity of cyP27A1 for the treatment of cerebrocendinous xanthomatosis. The present nucleic acid sequence represents one of a collection (ABK81903-ABK81930) of allele specific oligonucleotide (ASO) primers that were used in the invention to detect polymorphisms in the human CYP27Al

BP.

Colony stimulating factor 1 receptor (CSF1R) oligonucleotide #68.

```
The invention describes a novel isolated polymucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSTR) gene, found on The CC colony stimulating factor increasing the discovery and development of drugs for treating diseases associated with CSFIR activity, e.g., malignant historycosis, myeloid malignancies, and inflammatory disorders and the haplotypes can be used to validate CSFIR activity, e.g., with CSFIR activity, cencryping the CSFIR gene of an individual can also be used in developing diagnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in contains the correction for use in screening for candidate drugs to treat diseases related to CSFIR activity and in studying the effect of the variation on the biological activity of CSFIR. Antibodies are binding affinity of candidate drugs transgering CSFIR. Antibodies are cuseful in a variety of diagnostic and prognostic formats and therapeutic cuseful as probes and primers, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for testing the efficacy of target region. Without requiring any a priori knowledge of the phenotypic effect of any particular CSFIR or haplotype the invention provides a care useful contininal trials. This sequence is an allele specific oligonucleotide primer used for detecting CSFIR gene polymorphisms, decreating the intention the maching of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders.

number

The present invention provides the sequences of fragments of the human ubiquitin protein kinase B3A (human papilloma virus E6-associated protein) UBB3A coding sequence and protein. Also described are a number of single nuclectide polymorphisms (SNPs) identified within these fragments. The fragments can be used in the gene therapy of Angelman syndrome and to haplotype the UBE3A gene. The present sequence is an allele specific primer for a coding sequence fragment of the invention

```
The invention describes a novel isolated polynuclectide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSFIR) gene, found on The drugs for treating diseases associated with CSFIR activity, e.g., and inflammatory disorders and the haplotypes can be used to validate CSFIR activity, e.g., and the haplotypes can be used to validate CSFIR, as a candidate target for treating a specific condition or disease predicted to be associated with CSFIR activity. Genotyping the CSFIR gene of an individual can also be used in developing disgnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in corresponding to the variation on the biological activity of CSFIR, and in studying the effect of the variation on the biological activity of CSFIR. Antibodies are binding affinity of candidate drugs targeting CSFIR. Antibodies are cuseful in a variety of diagnostic and prognostic formats and therapeutic comethods. A transgent canimal is useful in studying expression of the CSFIR isogenes in vivo, for in vivo screening and testing of drugs cargeted against CSFIR protein, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonuclectides are care useful as probes and primers, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonuclectides are method for identifying lead compounds that are more likely to show the compounds of that are more likely to show the continue used for detecting CSFIR gene polymorphisms, the invention is an allele specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             described in the method of the invention

New genetic variants comprising haplotypes of the small inducible cytokine subfamily A, member 21 (SCYA21) gene, useful in improving the efficiency of screening for drugs for treating immunological disorders or for targeting SCYA21.
                                                                                                                                                                                                                  The invention relates to a novel isolated polynucleotide comprising a small inducible cytokine subfamily A (cys-cys), member 24 (SCYA24) isogene. The polypeptide of the invention has antiasthmatic activity. The polynucleotide may have a use in gene therapy. The polynucleotide and polypeptide are useful in the the development of drugs for treating diseases associated with SCYA24 activity, e.g. respiratory inflammatory diseases such as asthma. Allele-specific oligonucleotide (ASO) primers used for detecting polymorphisms in the SCYA24 gene are represented in ABLS7616-ABLS7645
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated polynucleotide, which comprises genes
                                                                                                                 New genetic variants of small inducible cytokine subfamily A member 24 gene, useful in studying expression and function of the protein, and for screening drugs to treat diseases such as asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Small inducible cytokine subfamily A (Cys-Cys) member 21; SCYA21; polymorphism; haplotype; immunological disorder; gene expression; drug development; immunomodulator; allele specific oligonucleotide;

and haplotypes of the small inducible cytokine subfamily A (Cys-Cys),
member 21 (SCYA21) gene. The polymucleotide comprises polymorphic sites
referred to as PSI-5 to designate the order in which they are located in
the gene. The polymorphisms and haplotypes of SCYA21 gene are useful for
validating whether SCYA21 is a suitable target for drugs to treat
immunological disorders and disorders associated with its abnormal
expression or function, screening for such drugs and reducing bias in
clinical trials of such drugs. Haplotype information would be useful in
improving the efficiency and output of several steps in the drug
discovery and development process, including target validation,
identifying lead compounds and early phase clinical trials. The methods
are useful in screening for compounds targetting SCYA21 to treat a
specific condition or disease predicted to be associated with SCYA21
cativity, e.g. immunological disorders. This sequence represents an
clinical psecific oligonucleotide primer used to identify polymorphic sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated human pyridoxal (pyridoxine, vitamin B6) kinase, (PDXK) polynucleotide. The polynucleotide is useful in studying the expression and function of PDXK, and in expressing PDXK protein for use in screening for candidate drugs to treat PDXK related diseases and for therapeutic purposes. A transgenic animal is useful for studying expression of the PDXK isogenes in vivo, for in vivo screening and testing of drugs targeted against PDXK protein, and for testing the efficacy of therapeutic against PDXK protein, and for testing the efficacy of therapeutic against and compounds for autoimmune polyglandular disease type 1. The polypeptide is useful for studying the effect of the

variation on the biological activity of PDXK and the binding affinity of candidate drugs targeting PDXK for the treatment of autoimmune bolyglandular disease type 1. Genotyping and haplotyping is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with PDXK activity, e.g., autoimmune polyglandular disease type 1, to validate PDXK as a candidate agent for treating a specific condition or disease predicted to be associated with PDXK activity, and in the design of clinical trials of candidate drugs. This sequence is one of 37 (see ABKEGGHI-ABKIGST) allels specific oligonucleotide (ABO) PCR primers used the activity and in the drugs of the mother of

Haplotyping, (H1), the G-protein coupled receptor 4 (GPR4) gene of an individual, comprising determining which haplotype an individual.

Example 2; Page 31; 61pp; English.

The invention relates to G-protein coupled receptor 4 (GPR4) gene variants. The data about the GPR4 polynucleotides and polypeptides and the polymorphisms associated with them are useful for haplotyping at the GPR4 locus. Allele-specific oligonucleotide (ASO) is useful as probes and primers for assaying a polymorphism in GPR4 gene. The present sequence is human GPR4 isogene fragment

Genotyping a human UDP glycosyltransferase 1 gene of an individual for determining the haplotype of an individual, involves determining the identity of a nucleotide pair at specific polymorphic sites for two copies of the gene.

Claim 16; Page 13; 81pp; English.

The invention relates to genotyping a human UDP glycosyltransferase (UGTIA1) gene of an individual, involving determining for the two copies of the UGTIA1 gene present in the individual, the identity of the two copies or collectide pairs of the individual has a haplotype or haplotype or pairs, given in the specification. It is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with UGTIA1 or cativity, e.g., Gilbert's syndrome and Crigler-Najjar syndrome, to validate UGTIA1 as a candidate agent for treating a specific condition or validate UGTIA1 as a candidate agent for treating a specific condition or disease predicted to be associated with UGTIA1 activity. The condition or disease predicted to be associated with UGTIA1 activity. In the condition or disease sectiated to far a cright UGTIA1 activity. A nucleic condition or disease sectiated out UGTIA1 activity. A nucleic specific condition or disease sectiated with UGTIA1 activity. A nucleic condition or disease sectiated by a seful in studying the corporation of uginal proving the corporation of uginal, and in expressing UGTIA1 protein for expression and function of use in screening for candidate drugs to treat diseases related to UGTIA1 corporation of uginal, and in expressing UGTIA1 protein for recombinant organism comprising (II) is useful for testing and testing of drugs creampentic agents and compounds for Gilbert's syndrome, in a biological system. Assessing the therapeutic agents and compounds for testing the efficacy of therapeutic agents and compounds for cities of syndrome and Crigler-conditions in the surface of the ugents and compounds for gilbert's syndrome, in a biological system. Assessing the therapeutic agents and compounds for gilbert's syndrome, in a biological system. Assessing the processing in the

```
The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABIA6034 to ABIA6367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                               Identifying oligonuclectides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under

The present invention describes an isolated polymucleotide (I) having a sequence (SI) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SiclaBA2) isogenes with regions of a sequence (SS) of 40023 bp (see ABL1954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (S2) complementary to (S1). (I) has cutinification; or a sequence (S2) complementary to (S1). (I) has antiinflammatory and neuroleptic activities, and can be used in gene therapy. Methods from the present invention can be used for haplotyping and genotyping the SIC18A2 gene in an individual. SIC18A2 is also known as the vesicular monoamine transporter (VMAT2). (I) is useful in studying the expression and function of SIC18A2, and in expressing the SIC18A2 cativity and in studying the effect of the variation on the biological activity of SIC18A2 as well as on the binding affinity of candidate drugs to treatment of respiratory inflammatory diseases such as neuropsychiatric disorders involving monoaminergic brain systems. The present sequence represents an allele specific incommentation (ASO) primer for human SIC18A2, which is given in the biological activity of the complements and allele such as the present sequence represents and allele such as the properties of the page of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Human; single nucleotide polymorphism; SNP; RANGAP1; paplotyphing chromosome 25413.2413.31; Ran GTPase activating protein 1; genotyping; cancer; irregular cell cycle associated disorder; ASO; probe; ss; allele-specific oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genotyping human Ran GTPase activating protein 1 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAPI) gene located on chromosome 22413.2-413.1, and methods for haplotyping and/or genotyping the RANGAPI gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the RANGAPI gene polymorphisms. The polymucleotides and screened compounds are useful for treatment of diseases associated with RANGAPI activity, such as cancer and other disorders associated with an irregular cell cycle. AAS19704-AAS19742, represent ASO probes for detecting human RANGAPI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, interleukin 8 receptor beta, IL8RB; ss; antinflammatory, probe; haplotypping, haplotype pair, single nucleotide polymorphism; genotyping; gene therapy, drug screening; chronic obstructive pulmonary disease; inflammatory disease; sequencing primer; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human IL8RB gene allele-specific oligonucleotide sequencing primer #11
                                                                      ASO probe #35 to detect human RANGAP1 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 15 BP; 3 A; 6 C; 3 G; 2 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 15; Page 14; 148pp; English

The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (IL8RB) gene. A method for haplotyping the interleukin 8 receptor beta (IL8RB) gene. A method for haplotyping the confident or more polymorphic sites and determining whether one of the copies of the gene is defined by an an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by a haplotype pair.

CC specification or whether both copies are defined by a haplotype pair.

CC specification or whether both or passociation between a trait and comparing the frequency of the IL8RB gene can be identified by comparing the frequency of the haplotype pair in a comparing the trait with the frequency of the haplotype or haplotype or haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair. In a corresponding by the trait population indicates the trait is associated with the haplotype or haplotype pair. InsRBB and its corresponding by corresponding by are used for studying the expression and function of ILBRB, for use in screening or confident edurgs to treat diseases related to ILBRB activity, such as chronic obstructive pulmonary diseases related to ILBRB activity, such as confident edurgs targeting ILBRB, sequences AAS95525-AAS95579 represent candidate drugs targeting ILBRB as well as on the binding affinity of allele-specific oligonucleotide probes, sequencing primers and PCR primers used to detect ILBRB gene polymorphisms
                                                                                                                                                                                                                                                                                              New polymorphic variants comprising interleukin-8 receptor beta (ILBRB) isogene, useful in expressing ILBRB protein for use in screening for candidate drugs to treat diseases related to ILBRB activity, e.g. inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

```
The present invention relates to a new polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for ADRB3 (Deta-3-denence) configuration acids as given in the specification, or its fragment, and the open comprises a sequence of 408 amino acids as given in the specification, or its fragment, and the opportion variant comprises one or more variant amino acids. The polymorphic variants are useful in studying the expression and function of ADRB3, in expression and ADRB3 protein for use in screening for candidate drugs to treat diseases related to ADRB3 activity, in studying the effect of the variation on the biological activity of ADRB3, and the binding affinity of candidate drugs targeting ADRB3 for the treatment of disorders and an early onset of non-insulin-dependent diabetes mellitus. Haplotyping methods are useful in validating ADRB3 as a candidate target for treating a specific condition or disease predicted to be associated with ADRB3 activity, or in the design of clinical trials of candidate drugs for treating a specific onclinical trials of candidate drugs for treating a specific oligonucleotide (ASO) primers (ASK11465- ABK11488) that were used in the methods of the invention to detect polymorphisms in the human ADRB3 gene
                                                                                                                                                                                                                                                                                                     Novel genetic variants of beta-3-adrenergic receptor gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. obesity, non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 15 BP; 2 A; 9 C; 0 G; 3 T; 0 U; 1 Other;

Choi JY, Chew A,

WPI; 2002-010724/01.

New isolated polynucleotide which is polymorphic variant of phospholipid transfer protein (PLTP) gene, having any one of polymorphic sites PS1-PS25, for studying function of PLTP, and expressing PLTP protein.

Claim 15; Page 73; 99pp; English

The invention relates to single nucleotide polymorphisms in the gene encoding the human phospholipid transfer protein (PLTP). A method for encoding the purp gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene in an individual comprises identifying the copies of the gene is defined by one of the PLTP haplotypes given in the specification or whether both copies are defined by a haplotype or pair: This method is useful in genotyping, whereby all possible haplotype or pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the haplotype or the trait with the frequency of the haplotype or haplotype or the trait oppulation indicates the trait is associated with the trait population indicates the trait is associated with the trait population indicates the trait is associated with the trait population indicates the trait is associated with the sequence are also useful for studying the effect of variation on the sequences are also useful for studying the effect of variation on the candidate drugs targeting PLTP for treating atherosolerosis. Sequences the represent allele-specific oligonucleotide probes, or many interest and PCR primers used for detecting PLTP gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargumetic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin C (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV concluding the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or repplication of hepatocellular carcinoma. The HCV inbeging are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a microarray comprising a support, a first probe for genotyping Mycobacterium species, second probe for differentiating Mycobacterium tuberculosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the third probe used for detecting antibiotic resistance in Mycobacterium strains. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-
use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or cadeling sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Microarray; probe; Mycobacterium; antibiotic-resistance; genotyping; ss.

The zinzyme is used to inhibit expression, in human therapy of e.g. cancer), in diagnosing gene expression, in human therapy of e.g. cancer), in diagnosing gene expression, in pharmaceutical, agricultural, research and diagnostic applications. Examples were given showing the optimisation of zinzymes targeting human K-ras and HERZ mRNA. The present sequence is a zinzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleoside triphosphate compound for use in inhibiting gene expression and in human therapy, such as, for the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HVV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, amberzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, are incleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primar sequences, as well as oligomucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV verse transcriptase primar sequences, as well as oligomucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HBV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HBV enzymatic nucleic acid sequence represents a substrate for one of the HBV enzymatic nucleic acid sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                   Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degemerative, disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pavco P,
                                                                                             HBV enzymatic nucleic acid substrate sequence #89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Morrissey D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 15 BP; 2 A; 6 C; 1 G; 0 T; 6 U; 0 Other;

A new method has been developed of breeding for corn with increased corn kernel oil concentration. The method comprises: (a) selecting a corn plant from a breeding population using at least one of the genetic compares 81375, 81384, 81394, 81416, 81432, 81457, 81480, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81476, 81477, 81876, 81477, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81876, 81977, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 81877, 818777, 81877, 81877, 818777, 81877, 818777, 818777, 818777, 818

AAZ65654 to AAZ69578 represent human biallelic markers, from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification of primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the defence in the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.

Diagnostic are contained as sequence in the Sequence Listing from the resease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S60 antigen; protozoacide; vaccine; intestinal infection; diarrhoea;
                                                                                             Human biallelic marker upstream amplification primer SEQ ID NO:7262.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a mammalian K+ channel protein with two pore domains, called TREX2 (TWIK-Related K+ Channel). The protein produces reurents whose current-voltage relationship is slightly inwardly rectifying in high symmetrical K+ conditions. TREK2 is a member of the fatty acid-activated and mechanosensitive K+ channel family. TREK-2 gene footed on chromosome 1431 is abundantly expressed in Kidney, pencreas and moderately in testis, brain, colon and small intestine. The mammalian K+ channel protein is useful in methods for screening various compounds. In particular, the protein is useful in methods for identifying biologically active compounds with anaesthetic properties. The present sequence is reverse transcription (RT) PCR primer used for analysing human TREK-2 gene exon-intron-exon DNA sequence used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mammalian K+ channel protein with two pore domains, for screening various compounds, particularly for identifying biologically active compounds with anesthetic properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                      The invention relates to Cryptosporidium parvum S60 potential vaccine antigen and its corresponding DNA molecule. S60 antigens are used in vaccine preparations for immunising animals, preferably human, against Cryptosporidium. The S60 protein is processed into two glycoproteins S15 and S45. This S45 and S15 glycoproteins behave as a single membrane glycoprotein S60. S60 vaccine antigen is used for treating intestinal infections such as diarrhoea in immunosuppressed patients e.g., AIDS fragulized Immune Deficiency Syndrome), cancer patients and recipients of sequencing Cryptosporidium parvum S60 gene

The cell is then lysed by chemical, enzymatic or physical agents and solubilised by exposing it to a denaturing agent, a reducing agent and a cysteine blocking agent, and is refolded into a bhologically active form by reducing agent, concentrations of denaturing and reducing agents. The protein may be to the growth hormone supergene family or may be an anti-angiogenesis to the growth hormone supergene family or may be an anti-angiogenesis factor. The method is useful for preparing a refolded, soluble form of an insoluble or aggregated protein. The proteins of the invention can act as delivery vehicles for enhancement of the circulatory half-life of the
                                                                                                                                                                                                                           The present sequence is a primer used in a method for monitoring antihepatitis B virus (HBV) drug resistance in a patient by genetic detection of any one of mutations L528M, M552V/I and/or V/L/M555I in HBV DNA polymerase in a biological sample from the patient. The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and precise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Making and refolding insoluble or aggregated proteins having free cysteine by exposing host cell expressing protein to cysteine blocking agent, and exposing to cysteine reactive group to increase their effectiveness.
Monitoring anti-HBV drug resistance by genetic detection of mutations DNA polymerase of HBV in patient's sample, involves hybridizing the polymucleic acids of the sample with a probe and detecting the hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88

Primer #2 (5'-3618-3639-3', see AAQ32872) was used with minus strand primer # (3'-420-4241-5', see AAQ32874) to amplify exon 4 of the human apolipoprotein E gene. The epsilon 7 mismatch mutation occurs in this region, at position 4141 and 4144. A set of four oligonucleotide probes was prepared to distinguish the wild type from the mutant base at the mismatch position for both the plus and the minus strands. The probe set AAQ32881-2 and AAQ32889-90 hybridises to nucleotides 4136-4149 of ApoB
                                                                                                                                    anchored polymerase chain reaction; APCR; apoE; mismatch; epsilon 2; epsilon 4; epsilon 5; epsilon 7; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Testing apolipoprotein E genotype - using polymerase chain reactor primers and labelled allele-specific oligonucleotide probe for hybridisation to amplified deoxyribonucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.5%; Score 10.8; DB 1; Length 14; 85.7%; Pred. No. 7.4e+02;

therapeutics that are attached or for directing delivery of a specific target within the body. Sequences ABK16774-ABK16852 represent PCR primers used in synthesis of the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This probe is used to screen a human liver cDNA library for the presence of a clone (pFFIXI) contey, the codding information for human factor IX. The recombinant DNA clone is useful for detect- ing mutations or other genetic deficiencies concerned with factor IX. It can also be used to diagnose blood clotting deficiencies e.g. haemophilia B. The use of recombinant DNA methods results in the large scale expression of hFIX polypeptides. See also AAQ10577 and AAQ10579

Primer #2 (5'-3618-3639-3', see AAQ32872) was used with minus strand primer #4 (3'-4220-4241-5', see AAQ32874) to amplify exon 4 of the human apolipoprotein E gene. The epsilon 7 mismatch mutation occurs in this region, at position 4141 and 4144. A set of four oligonucleotide probes was prepared to distinguish the wild-type from the mutant base at the mismatch position for both the plus and the minus strands. The probe set AAQ32881-2 and AAQ32889-90 hybridises to nucleotides 4136-4149 of ApoE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a polynucleotide probe which may be used in the detection of new hypervariable regions (HVR) in a DNA sequence. HVR represent a fingerprint useful in e.g. forensic science, paternity testing, animal breeding, etc. The probe may be used as part of a method for the efficient detection in humans or other animals, without the use of mini-satellites or primary enrichment. This sequence represents a probe for a wild type HIV reverse
transcriptase (RT) gene fragment. This sequence can be used in the method
of the invention for determining the susceptibility to antiviral drugs of
viruses which contain RT genes and are present in a biological sample. It
comprises: (1) releasing, isolating or concentrating the polynucleic
acids present in a sample; (2) amplifying the relevant part of the RT
captured acids of step (1) or (2) with at least two RT gene probes,
the probes being applied to known locations on a solid support, and are
capable of simultaneously hybridising to their respective target regions
under appropriate hybridisation and wash condition allowing the detection
of homologous targets, or with the probes hybridising specifically with a
sequence complementary to any of the target sequences; (4) detecting the
hybrids formed in step (3); and (4) inferring the nucleotide sequence at
the codons of interest (codons 38-44, 47-53, 65-72, 73-77, 148-154, 180-
constant isolates involved from the differential hybridisation signals
of viral isolates involved from the differential hybridisation signals
cobtained in step (4). The method is specifically used to detect antiviral
drug resistant strains of viruses containing RT genes, especially HIV
retroviruses and Hepadnaviridae. The method can also be used for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a probe for a wild type HIV reverse
transcriptase (RT) gene fragment. This sequence can be used in the method
cof the invention for determining the susceptibility to antiviral drugs of
viruses which contain RT genes and are present in a biological sample. It
comprises: (1) releasing, isolating or concentrating the polynucleic
acids present in a sample; (2) amplifying the relevant part of the RT
acids present with at least one suitable primer pair; (3) hybridising the
polynucleic acids of step (1) or (2) with at least two RT gene probes,
the probes being applied to known locations on a solid support, and are
capable of simultaneously hybridising to their respective target regions
under appropriate hybridisation and wash condition allowing the detection
of homologous targets, or with the probes hybridising specifically with a
sequence complementary to any of the target sequences; (4) detecting the
hybrids formed in step (3); and (4) inferring the nucleotide sequence at
the codons of interest (codons 38-44, 47-53, 65-72, 73-77, 148-154, 180-
CC 187, 212-216, and 217-220), and/or the amino acids of the codons of
interest and/or antiviral drug resistence spectrum, and possible the type
of viral isolates involved from the differential hybridisation signals
cobtained in step (4). The method is specifically used to detect antiviral
drug resistant strains of viruses containing RT genes, especially HIV
retroviruses and Hepadmaviridae. The method can also be used for
                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining susceptibility to antiviral drugs of reverse transcriptase containing viruses - useful for genotyping HIV RT and detecting antiviral

AAV997221 to AAV98043 and AAV9999 to AAV99000 represent specifically claimed target sequence from human EGF-R. AAV99004 to AAV99866 and AAV98867 to V9878 represent hammerhead ribozymes and halpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes enzymatic nucleic acid molecules (NAMs)

AAV48709-886 represent antisense oligonucleotides directed against the ExbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in ExbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in contain actuation in ExbB-2 protein expression, while coligonucleotides AAV4872-886 had little effect. The oligonucleotides and the invention. The specification describes oligonucleotides (as exemplify the invention. The specification describes oligonucleotides (contain 8-30 nucleotides able to form three H-bonds each to contain four consecutive nucleotides able to form two sequences of three consecutive cursoines; do not contain two sequences of three consecutive cursoines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cultonic form bonds (3R) is given by 2R/3R = 0.33-0.72. The cultonic form profiles are used to modulate expression of genes, particularly the genes for p53, BrB-2, junB, junD, 7GF-beta 1 or beta 2 to control confidence of primary cell cultures (e.g. bone marrow stem, liver or coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases consecution of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                        Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; harmerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antidiamatory; antiarthritic; antipsoriatic; ARNT; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous solerosis; pot-wine stain; Sturge Weber syndrome; Rippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.

comparises: (a) introducing into the system a random library of nucleic acid capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comparises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic acid, matchions in diseased cells and to determine caref RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of craft. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV939877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl colleaving activity, which specifically cleave RNA encoded by an aryl colleaving activity and apalyse subunit gene, or a Tie-2 gene. ```
capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (BBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonucleas activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, eg. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutchins in diseased cells and to determine craft RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modulations increases stability against nuclease and activity. AAV90922 to AAV93877 represent NACs that can be used in the cativity. AAV90922 to Racking the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenceis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.

```
The present sequence represents a polymuclectide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex tability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test DNA, attached to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the anchor DNA or reporter DNA, where either a part of the new with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bnzymatic nucleic acid; hammerhead ribozyme; virus replication; cleavage;

with a target sequence and contain at least one phosphoro (di)thioate with a target sequence and contain at least one phosphoro (di)thioate link, having endomuclease activity. (A), and more generally any catalytic muclet acid (A) that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium). In vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

Because of the high selectivity for targeted RNA, (A) can also be used correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

AAA24748 to AAA25992 represent their corresponding target sequences.

AAA24748 to AAA25902 represent their corresponding target sequences.
                                                                                                                                             New nucleic acids that interact, and optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                     The present invention describes nucleic acids (A) that interact stably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss

                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hairpin ribozyme, which cleaves the Hepatitis C virus (KTCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and thereferon to treat HCV infection, other infectious diseases, autoimmune diseases, and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                          Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; harmerhead ribozyme; hairpin ribozyme; antiense oligonuclectide; gene expression modification; cancer; phosphorothicate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

The invention relates to the discovery, identification and characterisation of toxic agents lethal to pathogens and methods for targeting such toxic agents lethal to pathogen infected cells in corder to treat and/or eradicate the infection. In particular the invention relates to at least one nucleic acid molecule, which cassociated with the transformation or plasmid copy number control, which hybridises to a viral polyadenylation signal or a core, pre core or hybridises to a viral polyadenylation signal or a core, pre core or hybridises to a viral polyadenylation signal or a core, pre core or copymerase encoding sequence. Specifically, the invention relates to the collivery of one or more toxic gene products, antisense RNAs, ribozymes, conjuvery of one or more toxic gene products, antisense RNAs, ribozymes, conjuvery of one or more toxic gene products, antisense RNAs, ribozymes, cortivity and can be used in gene therapy. They are useful for the activity and can be used in gene therapy. They are useful for the produce a cytocoxic or cytostatic effect in papillomavirus or hepatitis B infected cells. The papilloma virus induced conditions and can infected cells. The papilloma virus induced conditions is selected from artyces a papilloma bandozs88-ABAO2610 comprise ribozyme flanking cervical dysplasia, cervical cercinoma, carcinoma in situ and contributed conditions and can be useful for the formation of a papilloma bandozs88-ABAO2610 comprise ribozyme flanking cervical cervic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            d
                                                                                                                                                                                                                                                                                   with a target sequence and contain at least one phosphoro (dilthicated link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates excession of the oestrogen receptor cancer, are used to treat cancer (particularly of breast or endomerrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

Correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, cancel the high selectivity for targeted RNA, (A) can also be used to particularly for identification of therapeutic targets, and as research respects to mucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAAA2503 to AAAA2474 to AAAA2592 represent ceceptor hammerhead ribozyme sequences.

AAAA2593 to AAAA2610 represent oestrogen receptor hairpin ribozyme sequences. AAAA26219 to AAAA2621 represent other ribozyme sequences and anticesses oligonucleotides used in the exemplification of the present

This invention relates to oligonucleotides used for cleaving, detecting and amplifying the mecA gene (associated with methicillin resistance in Staphylococcus aureus) or its derived RNA. The invention also comprises a detection method employing an RNA amplification process, using RNA derived from the mecA gene as template. Also disclosed is a detection method for a methicillin-resistant S. aureus (WRSA), comprising an RNA method for a methicillin-resistant S. aureus (WRSA), comprising an RNA camplification process in the presence of a complementary oligonucleotide probe labelled with an intercalated fluorescent dye, where complementary binding of the probe to the RNA transcription product results in a change of the probe to the RNA transcription product results in a change of the fluorescent property relative to that of a situation where a complex formation is absent, and then measuring the fluorescence complexed to the relative to the Complexity of the reaction solution. The oligonucleotides may be used as primers or probes, for detecting methicillin-resistant S. aureus in colinical samples. They may also be used therapeutically to inhibit RNA reverse transcription or translation. These oligonucleotides permit rapid and very sensitive detection/identification of the mecA gene, at a call very sensitive detection/identification of the mecA gene, at a call translatively low temperature without the need for heat denaturation of target RNA. The present sequence represents a methicillin resistant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide specific for the mecA methicillin-resistance gene, useful for cleavage, detection and amplification of the gene or related
invention are useful for determining the expressed amount of E2F or the transcription activity of E2F. The present sequence represents an E2F detection oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Methicillin resistant Staphylococcus Aureus; MRSA; primer; ss; mecA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methicillin resistant Staphylococcus aureus detection primer #17.

and amplifying the meck gene (associated with methicillin resistance in stably) cooccus aureus) or its derived MNA. The invention also comprises a detection method employing an RNA amplification process, using RNA detection method for a methicillin-resistance in derived from the meck gene as template. Also disclosed is a detection method for a methicillin-resistant S. aureus (MRSA), comprising an RNA methicillin-resistant S. aureus (MRSA), comprising an RNA method for a methicillin-resistant S. aureus (MRSA), comprising an RNA method for a methicillin-resistant S. aureus (MRSA), comprising an RNA completed with an intercalated fluorescent dye, where complex formation is absent, and then measuring the fluorescence in the fluorescent property relative to that of a situation where a complex formation is absent, and then measuring the fluorescence intensity of the reaction solution. The oligonucleotides may be used as primers or probes, for detecting methicillin-resistant S. aureus in creverse transcription or translation. These oligonucleotides permit rapid and very sensitive detection/identification of the measuration of relatively low temperature without the need for heat denaturation of target RNA. The present sequence represents a methicillin resistant cranger RNA. The present sequence represents a methicillin resistant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò

Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay.

Claim 2; Page 29; 117pp; English.

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, V181C/I, M184V/I, V186L, C190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/J/L, V181C/I, O151M/L, M184V/I, Y181C, G190A/S/R and/or C715Y/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance or mutation as associated with anti-HIV drug resistance with drug resistance of sequences and probes which are used in the exemplification of the present

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at associated with anti-HIV drug resistance in a patient by detecting at cleast one of the mutations K100N/R, V106A/IL, V181C/I, M184V/I, Y18BL, C G190A/S/R, T15Y/F/D/S/A and/or C15IM/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes (CC of HIV strains in a biological sample using a specific set of probes (CC determining viral mutations and/or polymorphisms in the HIV RT gene cascolated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, CC 7215Y/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and session mutations associated with drug resistance of viruses containing RT genes. ABZ34542 represent HIV RT sequences and probes which are used in the exemplification of the present

```
The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or inbozyme is in a hammerhead (HH). The card or indoor in a partial in a hammerhead (HH). The the substrate sequences defined in the specification. The HCV is consisted to modulating the expression and/or replication of HCV. They can be used to treat circhosis, liver failure and/or replication of HCV. They can be used to treat circhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hairpin (HP) ribozyme. Note: Some of the sequence data for this patent was printed specification. The complete sequence data for this patent was constant and electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                            Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory, substrate; hairpin ribozyme; HP ribozyme; se.
                                                                                          Hepatitis C virus substrate #24 for HCV hairpin ribozyme #24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to peptide nucleic acid (PNA) probe comprising a probing nucleobase sequence. The PNA probes are useful for detecting, identifying and/or quantifying Candida yeast in clinical samples, food, beverages, water, dairy products or environmental samples, personal care products, pharmaceutical products, for analysing or detecting the presence of a nucleic acid within an organism, or for the analysis of organisms or a nucleic acid extracted from or derived from an organism of interest. The present sequence is a probing nucleobase sequence of PNA probe specific for Candida glabrata. This sequence is used for detection of Candida yeast
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide nucleic acid probes comprising a probing nucleobase sequence, useful for detecting, identifying and/or quantifying one or more species of candida yeast in clinical samples, food, beverages, or environmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; sth discorder; Insulin-like Growth Factor I receptor; IGF-1; ptyriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keardosis; neoplasia; scleroderme; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis, kidney disease; neoblasis condition; hyperplasis; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP5 must s, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. seteoporosis. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGR]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperrecovascular condition such as a neovascular condition of the retina, characteristic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                    The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAPF5151 and AAF4153-P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Selection of low frequency antigen-specific B lymphocytes - using antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer; amplify; human; heavy; H; kappa; K; chain; variable; V; lymphoblastoid; IgG; immunoglobulin; B cell; semi-nested PCR; ss.

The sequences given in AAQ48499-514 are primers which amplify human heavy corresponding segments almost 100% of the time in single cells taken from the human lymphoblastoid 100% of the time in single cells taken from the human lymphoblastoid 100% of the time in single cells taken from the human lymphoblastoid 100% of the times and cover the known sequences of the 155 VH segments which have been sequenced. The known sequences from single B cells is amplified by semi-nested PCR. The procedure calls for two rounds of PCR amplification. The same sets of degenerate 5' VH and VK primers are used for both rounds of PCR, whereas the 3' primers used in the second round of PCR are derived from the first round. Therefore in the second round of PCR the 5' end is not nested but the 3' end is. The VH and VL gene segments amplified in the first round, Therefore in the second round of PCR the 5' end is not nested but the 3' end is. The VH and VL gene segments amplified by this method may be cloned and sequenced by incorporating them into an file id.)
                                                                                                                                                                                                                                                                                                                                                                                                         ö

The sequences (AAQ52824-Q52890) are pref. Cytomegalovirus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERNS interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       \mathtt{Enzymatic} \mathtt{RNA} molecules - used to inhibit viral replication, infection and gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences (AAQ52824-Q52890) are pref. Cytomegalovirus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic RNA molecules - used to inhibit viral replication, infection

Selecting antigen-specific B lymphocytes - by fluorescence activated cell
                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                            New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer, amplification; Vh; heavy chain, antibody; B cells; lymphocyte; immunoglobulin; PCR; polymerase chain reaction; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAQ73325-81 represent oligonucleotides which hybridise specifically with DNA or RNA from a herpes virus gene corresponding to one of the open reading frames UI5, -8, -9, -50, -27, -30, -42, -52 or 18175 of herpes simplex virus type I (HSV-1). These oligos pref. hybridise with a translation initiation site, a coding region or a 5' untranslated region. These oligos may be used in compositions for the treatment and diagnosis of herpes viral infection, by contacting the virus or the animal, or its cells, issues or body fluids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotide(s) hybridising with DNA or RNA of herpesvirus gene are used in the treatment and diagnosis of herpes simplex virus, cytomegalovirus, Epstein Barr virus and varicella zoster infections.

                                                            This oligonucleotide is suitable to be used as a 5' end primer for human verbal coding segments. The preferred set of 5' end primers for Vh consists of 5 degenerate groups of oligonucleotides and one nondegenerate oligonucleotide (AAQ68539-44), totaling 53 sequences. This set of primers corresponds to the first 5 amino acids of the mature immunoglobulins and sequenced. The variations in this sequence which yield these other sequenced. The variations in this sequence which yield these other oligonucleotides are that the first guanidine uncleotide can be a cytosine, the sixth guanidine can be a thymidine and the thirteenth guanidine can be a thymidine can be correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fibrosis gene. The primers are designed to be complementary to eight of the most common mutations within the CP gene. Detection is carried out by the incorporation of a labelled dideoxynucleotide. Individuals carrying the mutation incorporate a different base as opposed to normal individuals. This primer detects the delta-507 mutation site by the incorporation as gdayp as opposed to ddgTP. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The primers (AAQ55452-62) are use to detect mutations within the cystic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is an antisense molecule directed against position +4 to +18, relative to the start codon of the gene for mouse fibroblast growth factor 1. The polynucleotide can be used for inhibiting vascular smooth muscle cell proliferation and for treating a disease e.g. vascular stenosis, post angioplasty restenosis, atherectomy, atherosclerosis, artial venous shunt failure, cardiac hypertrophy, vascular surgery and organ transplant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotides (AAQ81716-20) are antisense oligonucleotides complementary to the mRNA of the fibrogenic cytckine tumour necrosis factor-alpha (TNP-alpha) which inhibit expression of this cytokine. The oligonucleotides may contain phosphorothicate linkages to render the nuclease resistant. They are used to inhibit scar formation at a wound site by preventing the production of fibrogenic cytokines such as transforming growth factor-beta (TGP-beta), TNP-alpha, platelet derived growth factor (PDGF), fibroblast or epithelial growth factors (FGF or EGF) or interletkins 1 or 6 (IL-1, IL-6) which are released at high level at the wound periphery. The oligonuclectides reduce collagen content of the wound and increase tensile strength. Treated wounds are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New anti-sense oligo-nucleotide(s) to mRNA of fibrogenic cytokine - esp. transforming growth factor-beta and platelet derived growth factor, used topically to inhibit scar formation at wound sites.
                                                                                                                               Antisense; fibrogenic; cytokine; transforming growth factor-beta; TGF-beta; phosphorothioate; scar; wound; tumour necrosis factor-alpha; TNF-alpha; platelet derived growth factor; PDGF; fibroblast; epithelial; growth factor; RGF; interleukin; IL-1; IL-6; collagen; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves mRNA coding for a protein of respiratory syncytial virus (RSV) at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2; Page 274; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the tundelectide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant asfjection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; by bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myoardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nuclectide base position indicated in the DE line. The relA gane product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target cusful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                  b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

(RIBO-) RIBOZYME PHARM INC

Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

Claim 2; Page 269; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves mRNA coding for a protein of respiratory syncytial virus (RSV) at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the target sequences and can be used for treatment and diagnosis of RSV infection. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct PI

Modak A,
Tracz D,
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain permitted and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target cuestul for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanced itssues. The potentially immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                   o DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 2; Page 276; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA. Regions of the mNNA that condary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these manks sequences were designed and synthesised with modifications that emprove their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumacoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a preferred target sequence for an enzymatic nucleic acid (1.e. a ribozyme) which oleaves mRNA coding for a protein of respiratory syncytial virus (RSV) at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain porential hammerhead and hairplin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the target sequences and can be used for treatment and diagnosis of RSV infection. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct PI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 2; Page 269; 407pp; English.

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant arejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stinchcomb DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW; Grimm S, Karpelsky A, Kisich K, Matulic-Adamic J, Mcswiggen JA; Modak A, Pavco P, Baljeman L, Sullivan SM, Sweedler D, Thompson JD; Tracz D, Usman N, Wincott FE, Woolf T;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-KappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites mRNA sequences by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nucleas resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential communosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adinesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; dironic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; artherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

Grimm S, Modak A, Tracz D,

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves mRNA coding for a protein of respiratory sproytial virus (RSV) at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Grimm S,
Modak A,
Tracz D,
  The present sequence represents a preferred target sequence for an entractic claves relab manh at the nucleotide base position indicated in the DE line. The rela gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences of prompter analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and aschma as well as for increasing tolerance to transplanted tissues. The potential immunouspressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes disected against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant arejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-WAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enkrymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; Ry, bcr-ab; oncogene; translocation; dironic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myoardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Grimm S,
Modak A,
Tracz D,
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain product analysis. Ribozymes directed against these mRNA sequences were designed and halrpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted itssues. The potentially immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AlDS. (Updated on 25-MAR-2003 to correct PI field.)

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyms cleavage sites were identified by computer analysis. Ribozyms directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the target sequences and can be used for treatment and diagnosis of RSV infection. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct PI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 2; Page 276; 407pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a preferred target sequence for an the present cucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatorid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a polynuclectide which forms part of a peptide nucleic acid (PNA) molecule of the invention. The invention relates to compounds comprising a PNA strand including at least one PNA unit having a pryntmidine heterocyclic base which is a C-pyrimidine heterocyclic base. The invention also relates to or an iso-pyrimidine heterocyclic base. The invention also relates to compounds which optionally consist of multiple strands for increased binding affinity. The compounds (secionated PNA or bis PNA compounds) control to complementary nucleic acids with higher affinity and specificity than corresponding polynucleotides and are resistant to degradation by control or corresponding polynucleotides and are resistant to degradation by control or treating diseases such as cancer, viral infections or genetic diseases. They can also be used for research and in diagnostics for diseases. They can also be used for research and in diagnostics for catcuration and isolation of specific nucleic acid sequences and as biotechnology and research probes, primers or artificial restriction enzyme stranded DNA, restriction enzyme sites, transcription inhibition, clamping to detect point mutations and for use in Hoogsteen strands in triplexing motif

The present sequence is the peptide nucleic acid (PNA) oligomer ISIS 8129, which specifically binds 1 strand of the NFKappaB transcription factor (TF) binding site on a double stranded DNA in an anti-parallel orientation, and displaces the 2nd strand of the double stranded DNA to inhibit the binding of NFKappaB to its binding site. As the PNA can inhibit the transcriptional activation of a gene, it can be used to treat diseases associated with TF mediated gene expression, e.g. inflammatory disease, ALDS, TF mediated cancer, atherosclerosis, Down's syndrome, Alzheimer's disease, amyotrophic lateral sclerosis and parkinson's disease. The PNA can also be use to identify TF associated with certain disease states. Specifically ISIS 8129 and its parallel binding partner ISIS 9151 bind a single copy of the target with high affinity to form a
                                                                    ö

                                                                                                                                ò
                                                                                                                                                     ď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 tibose residues (i); (ii) a 2.°C-allyl modification at position 4 of the ENA; (iii) at least ten 2.°C-allyl modification; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis. The ENA's can also be used to treat antigen presenting calls of adonor to induce tolerance be used to treating arthritis. They can also be used to treat antigen presenting calls of a donor to induce tolerance enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy inmacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone.

The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;
The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of auto-immune diseases.
be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for treating graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therezpy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of tibozyme required to affect a therspectic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues (ii) a 2'-callyl modification at position 4 of the ENA; (iii) at least ten 2'-callyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for chanding graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The present than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prodn. of nucleoside dimers with methylenedioxy linkage - by reacting 5'-protected nucleoside 3'-methylthio:methyl ether and 3'-protected nucleoside with bromine.
           Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Prodn. of nucleoside dimers with methylenedioxy linkage - by reacting 5'-protected nucleoside 3'-methylthio:methyl ether and 3'-protected nucleoside with bromine.
                                   The invention relates to a method for linking a first nucleoside or oligonucleotide to a second nucleoside or nucleotide through an OCHIZO linkage, starting with a 5'-protected nucleoside or nucleotide which is derivatised in the 3'-posttion with an OCHIZSMe group. The method comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-postected nucleoside or nucleotide and a 3'-postected nucleoside or nucleotide and a structured nucleotide or nucleotide and with tetrabutylammonium fluoride (TDAF) in tetrahydrofuran (THF). The COHIZO-linked dimers can be used in the synthesis of oligonucleotide analogues (containing thioformacetal linkages) e.g. useful as diagnostic agents (see WO9106629)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for linking a first nucleoside or oligonucleotide to a second nucleoside or nucleotide through an OCH220 linkage, erating with a 5-proected nucleoside or nucleotide which is derivatised in the 3' position with an OCH28Ne group. The method comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-protected nucleoside or nucleotide and en a 3'-diethylpyridine (DEP) and molecular sieves; and (b) treating the proceed with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (THF).                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for linking a first nucleoside or oligonucleotide to a second nucleoside or nucleotide through an OCH2O linkage, starting with a 5'-protected nucleoside or nucleotide which is derivatised in the 3' position with an OCH2SMe group. The method comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-protected nucleoside or nucleotide with bromine in the presence of 2.6 diethylpyridine (DEP) and molecular sieves, and (b) treating the product with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (TBF). The one OCH2O-linked dimers can be used in the synthesis of oligonucleotide analogues (containing thioformacetal linkages) e.g. useful as diagnostic agents (see WO9106629)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleoside dimers with methylenedioxy linkage - by reacting 5'-nucleoside 3'-methylthio:methyl ether and 3'-protected
  OCH2O-linked dimers can be used in the synthesis of oligonucleotide analogues (containing thioformacetal linkages) e.g. useful as diagnostic agents (see WO9106629)

The method comprises (a) treating the derivatised nucleoside or nucleotide and a 3'-protected nucleoside or nucleotide with bromine in the presence of 2,6-diethylpytidine (DEP) and moleotide with bromine in the presence of 2,6-with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (THF). The OCH2O-linked dimers can be used in the synthesis of oligonucleotide and analogues (containing thioformacetal linkages) e.g. useful as diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Prodn. of nucleoside dimers with methylenedioxy linkage - by reacting 5'-protected nucleoside 3'-methylthio:methyl ether and 3'-protected
                                                                                                                                                                                                               OCH2O linkage; analogue; 2,6-diethylpyridine; DEP; molecular sieve;
tetrabutylammonium fluoride; TBAF; tetrahydrofuran; chemical synthesis;
THF: thioformacetal linkage; diagnostic agent; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Specifically designed oligodeoxyribonucleotides form triplexes in single-
or double-strand DNA at homopurine-homopyrimidine targets. These
triplexes block in vitro DNA synthesis by all DNA polymerases studied,
including Sequenases. Taq, Vent, and Pol I. A similar phenomenon occurs
when DNA polymerases are supplemented with accessory replication
proteins, including SBB protein. Replication blockage is highly sequence-
specific and even one or two point substitutions within either the target
sequence or the oligonucleotide abolish the effect. Sequence-specific
blocking of DNA replication in vivo is facilitated by the methods and
compositions of the present invention. The present sequence is the ORF-Bc
human papilloma virus (HPV) terrget (position 436-452 in HPV57 and 438-452
in HPV2) for triplex-forming oligonucleotides AAT35030-31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage; neutral lipid transfer; plasma lipoprotein; atherosolerosois; atherectomy; reverse cholesterol transport; high density lipoprotein; therapy; CTPP; familial hypercholesterolaemia; dyslipidaemia; hypoalphalipoproteinaemia; peripheral vascular disease; hyperbetalipoproteinaemia; angloplastic restenosis; low density lipoprotein; diabetes; HDL; rabbit; LDL; ss.
